Hanna Instruments, Inc., Introduces HALO2, a New Line of Wireless pH Testers

Smithfield, RI, December, 2021 – Hanna Instruments, Inc. (Hanna) is excited to introduce its newest product line, HALO2 Wireless pH Testers.

Hanna's HALO2 Wireless pH Testers combine the best of both worlds for its customers, a professional pH electrode paired with Bluetooth® 5.0 Wireless Technology. This enables users to turn a phone or tablet into a laboratory grade pH meter.

With the HALO2 product line, testing with a professional electrode is no longer limited to just a laboratory setting. Its compact design and data logging capabilities helps users achieve high quality results in any testing environment.

With a tester for every application and 15 styles to choose from, Hanna's HALO2 Wireless pH testers are useful for various industries. These testers are perfect for collecting pH measurements out in the field, in a laboratory or classroom, or even as part of the food production process.

"We're very excited to bring HALO2 Wireless pH Testers to the market. These testers provide our customers with a versatile and convenient testing experience. The HALO2 line turns your phone or tablet into a professional pH meter, allowing users to test literally anywhere and achieve precise results," states Justin Mecys, Head of Product Portfolio Development for Hanna Instruments, Inc.
