Rob Watkinson,

Sales Manager at Resolve Optics commented “Vision systems for military purposes increasingly require durable, high-performance lenses that can withstand harsh environmental conditions and meet strict, traceable military quality standards. In recent years we have worked with a growing number of military vision equipment suppliers to design and supply robust, high-performance lenses for aircraft head-up display, tank sight, automated return fire and thermal imaging applications”.

He added

“Our partners not only value the advanced performance our lenses deliver, but also our investment in advanced testing equipment to cover all aspects of required vibration and shock testing during both the qualification and production phase of creating a new optical system. This way we minimise the chance of a vital military vision lens failing on deployment”.

Resolve Optics

offers military vision equipment suppliers the peace of mind of security of supply for custom-designed lenses by guaranteeing their availability for as long as they need them. This includes exclusivity of design for certain quantities, allowing customers to maintain a competitive edge.

Resolve Optics

has been supplying lenses and optical systems for military vision applications for over 20 years.
